

Workout Logger — diagrams

Structural and behavioural diagrams (Mermaid, renders on GitHub). See `DESIGN.md` for the authoritative architecture record and `CLAUDE.md` for invariants. Diagrams reflect the current code.

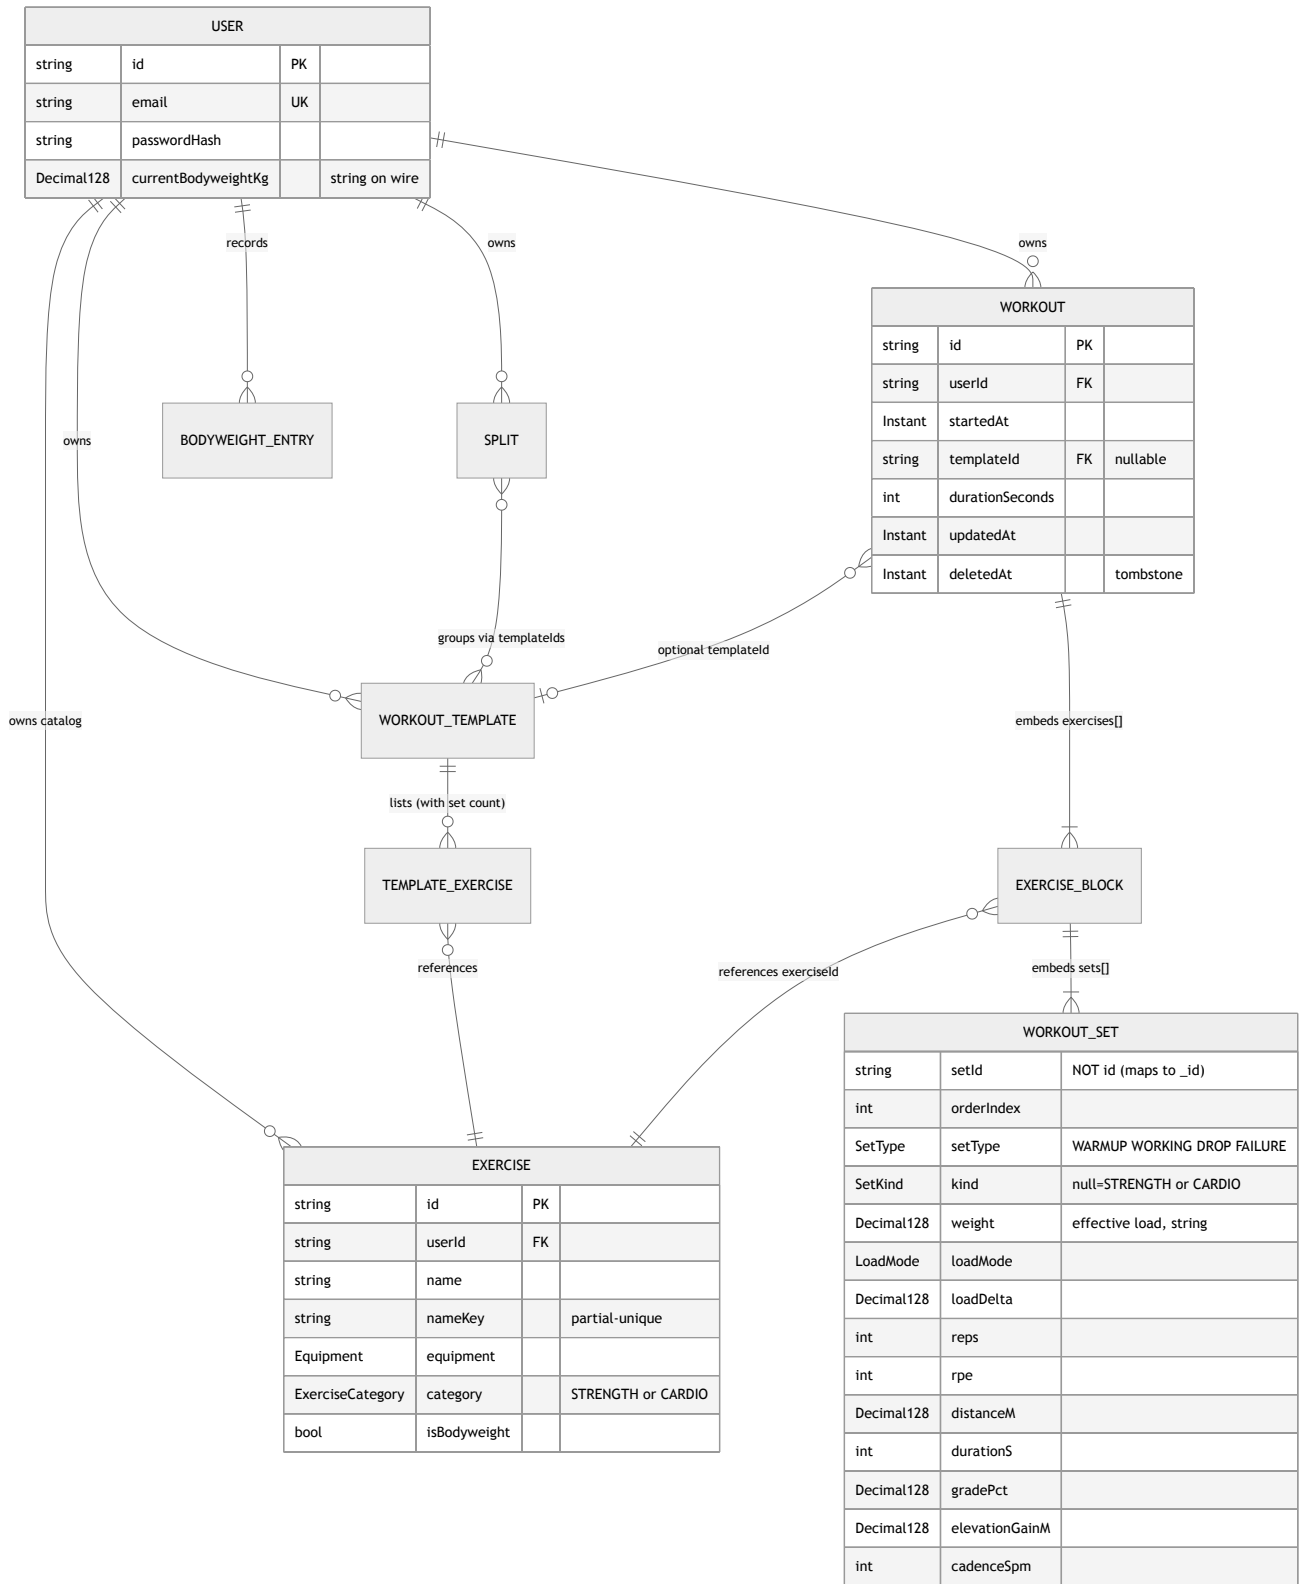

Structural

1. System architecture (components & runtime)

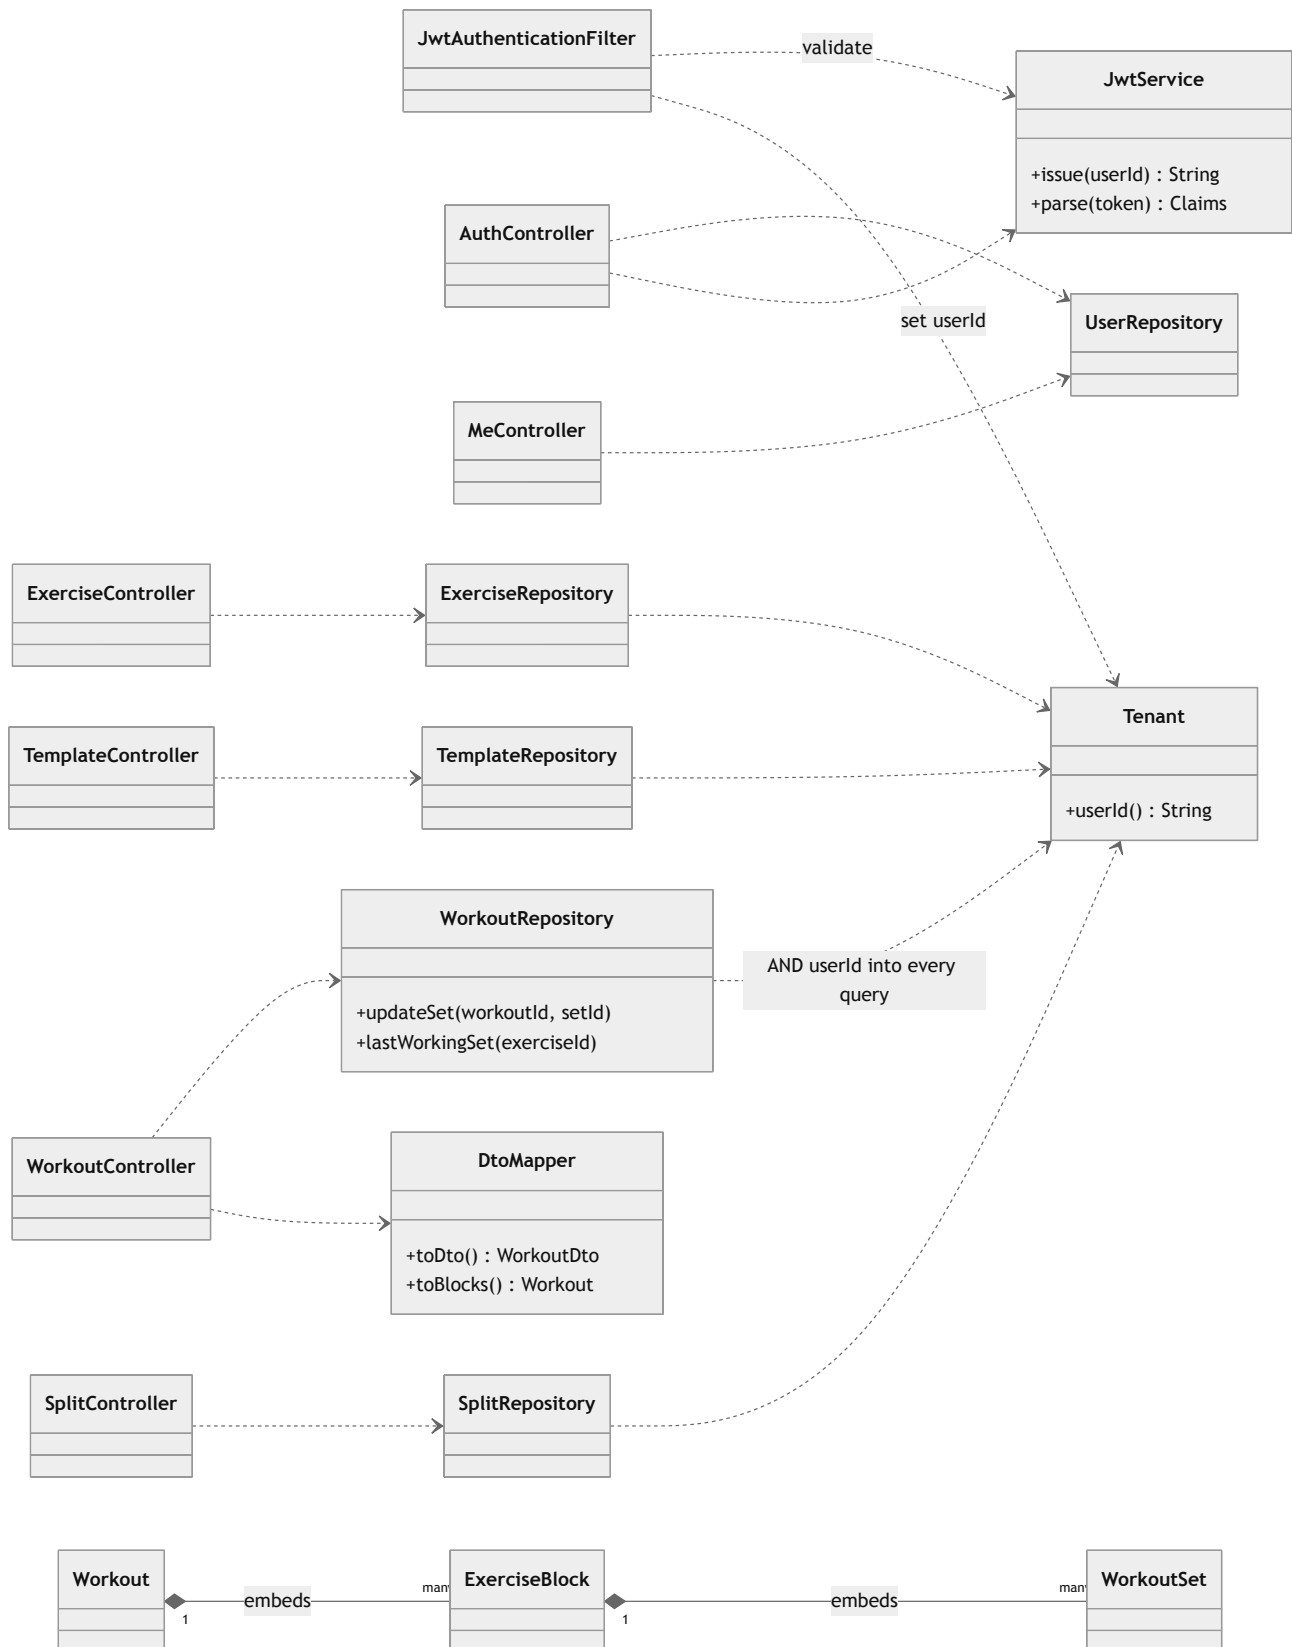

2. Data model (collections, embedding & references)

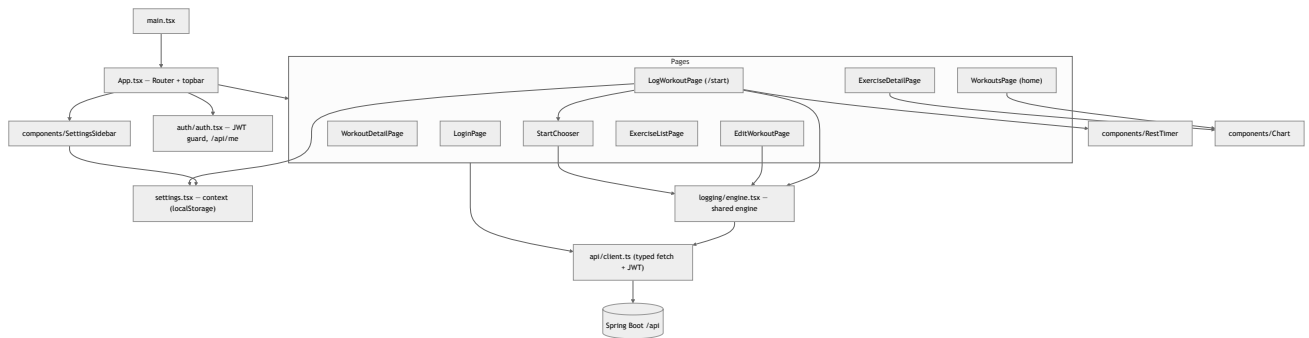

A **workout session** is one document that embeds `exercises[]`, each embedding `sets[]`. Everything else relates by id reference (many-to-many), not joins. Every collection is scoped by `userId`.

3. Backend layers (request path + tenant isolation)

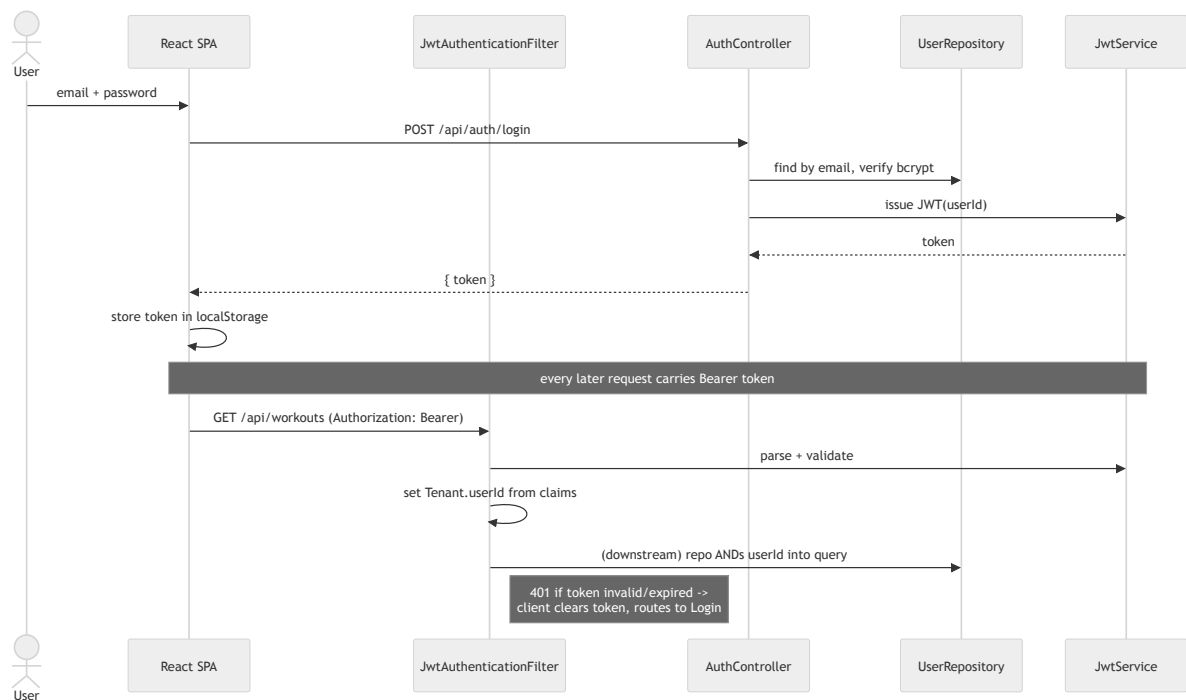

4. Frontend modules

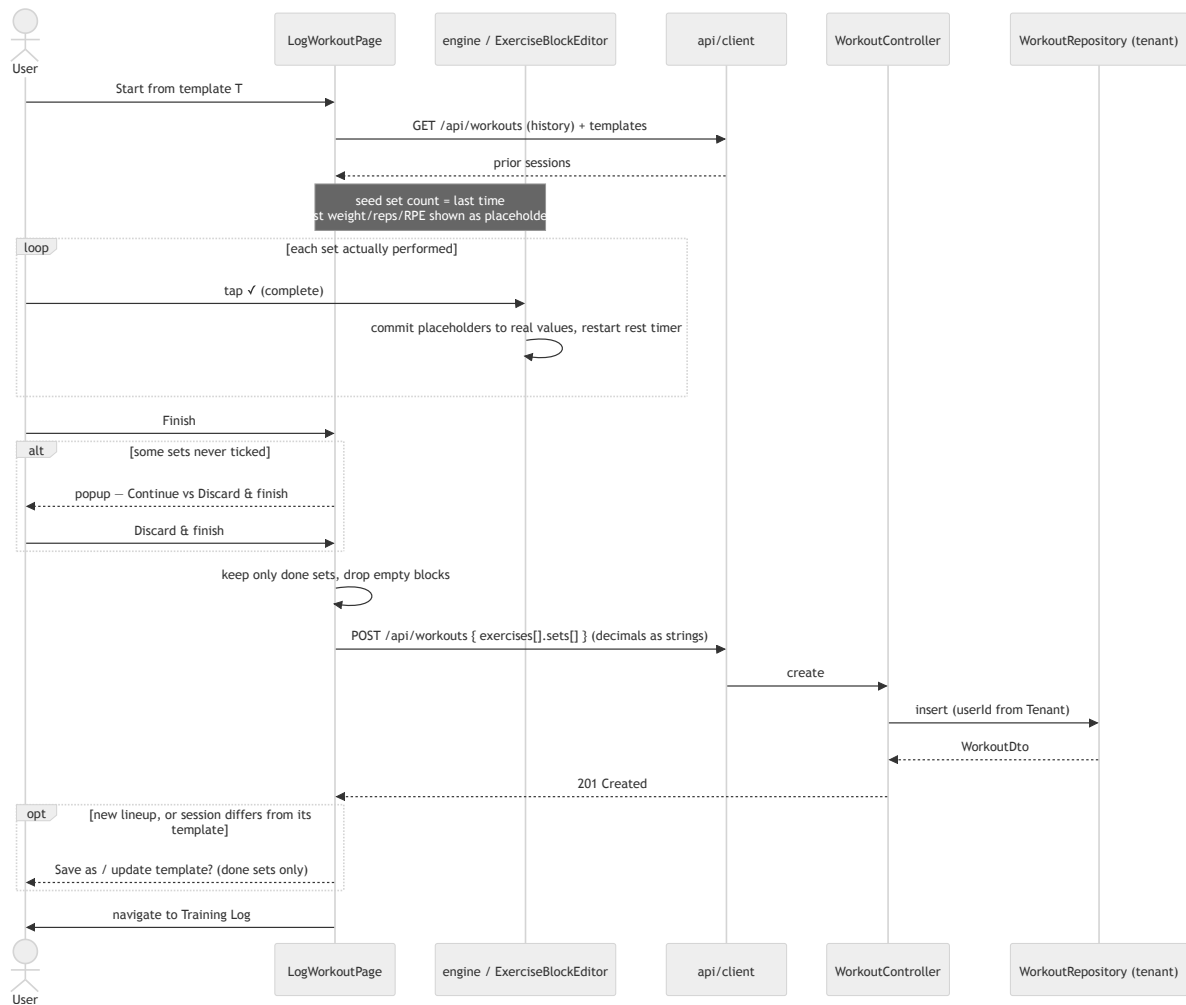

Behavioural

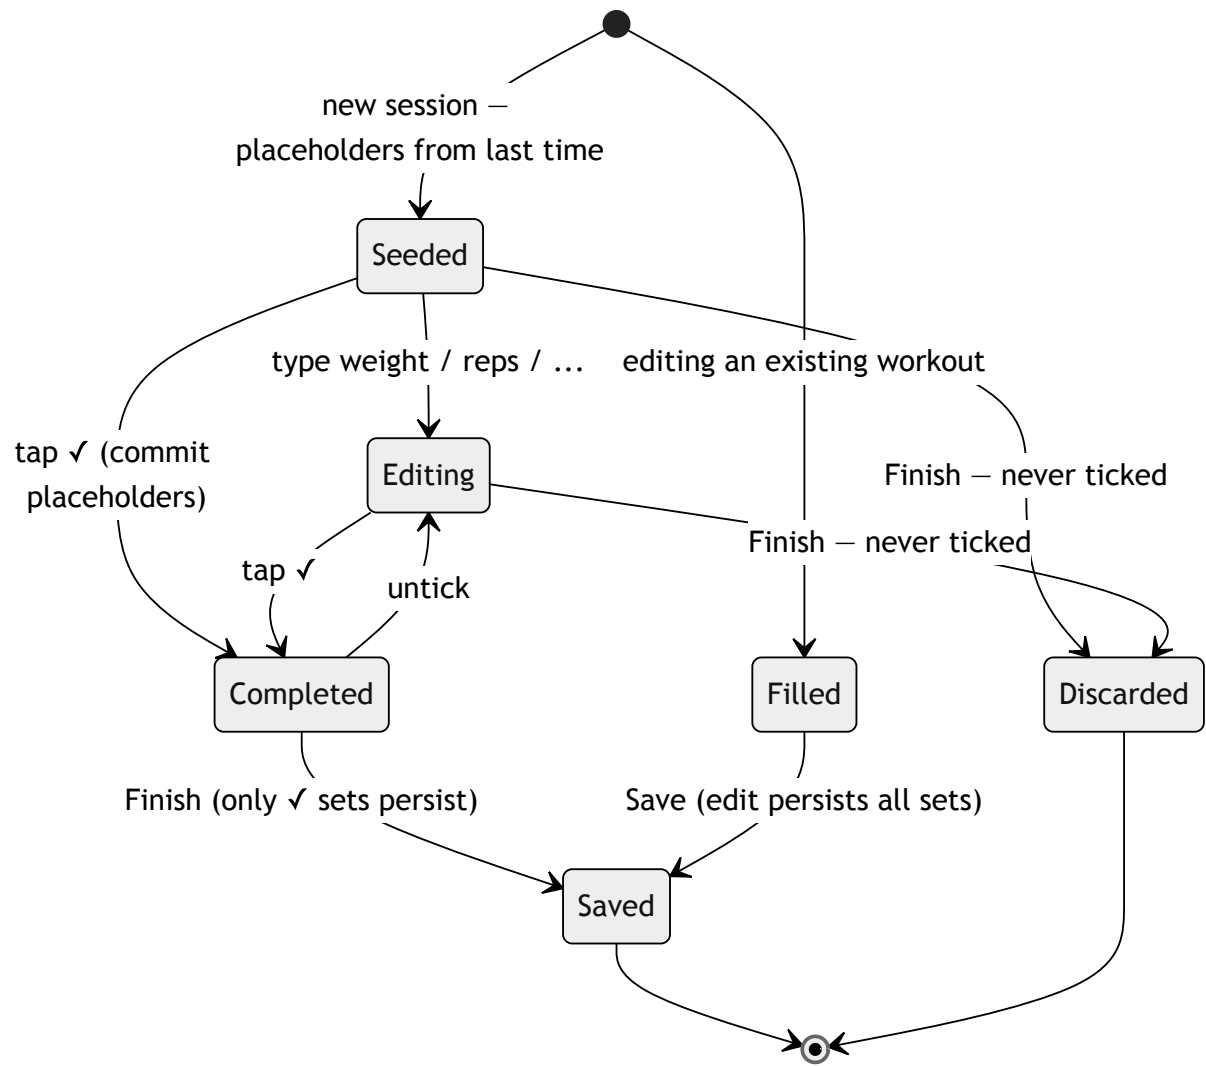

5. Authentication & per-request tenant isolation

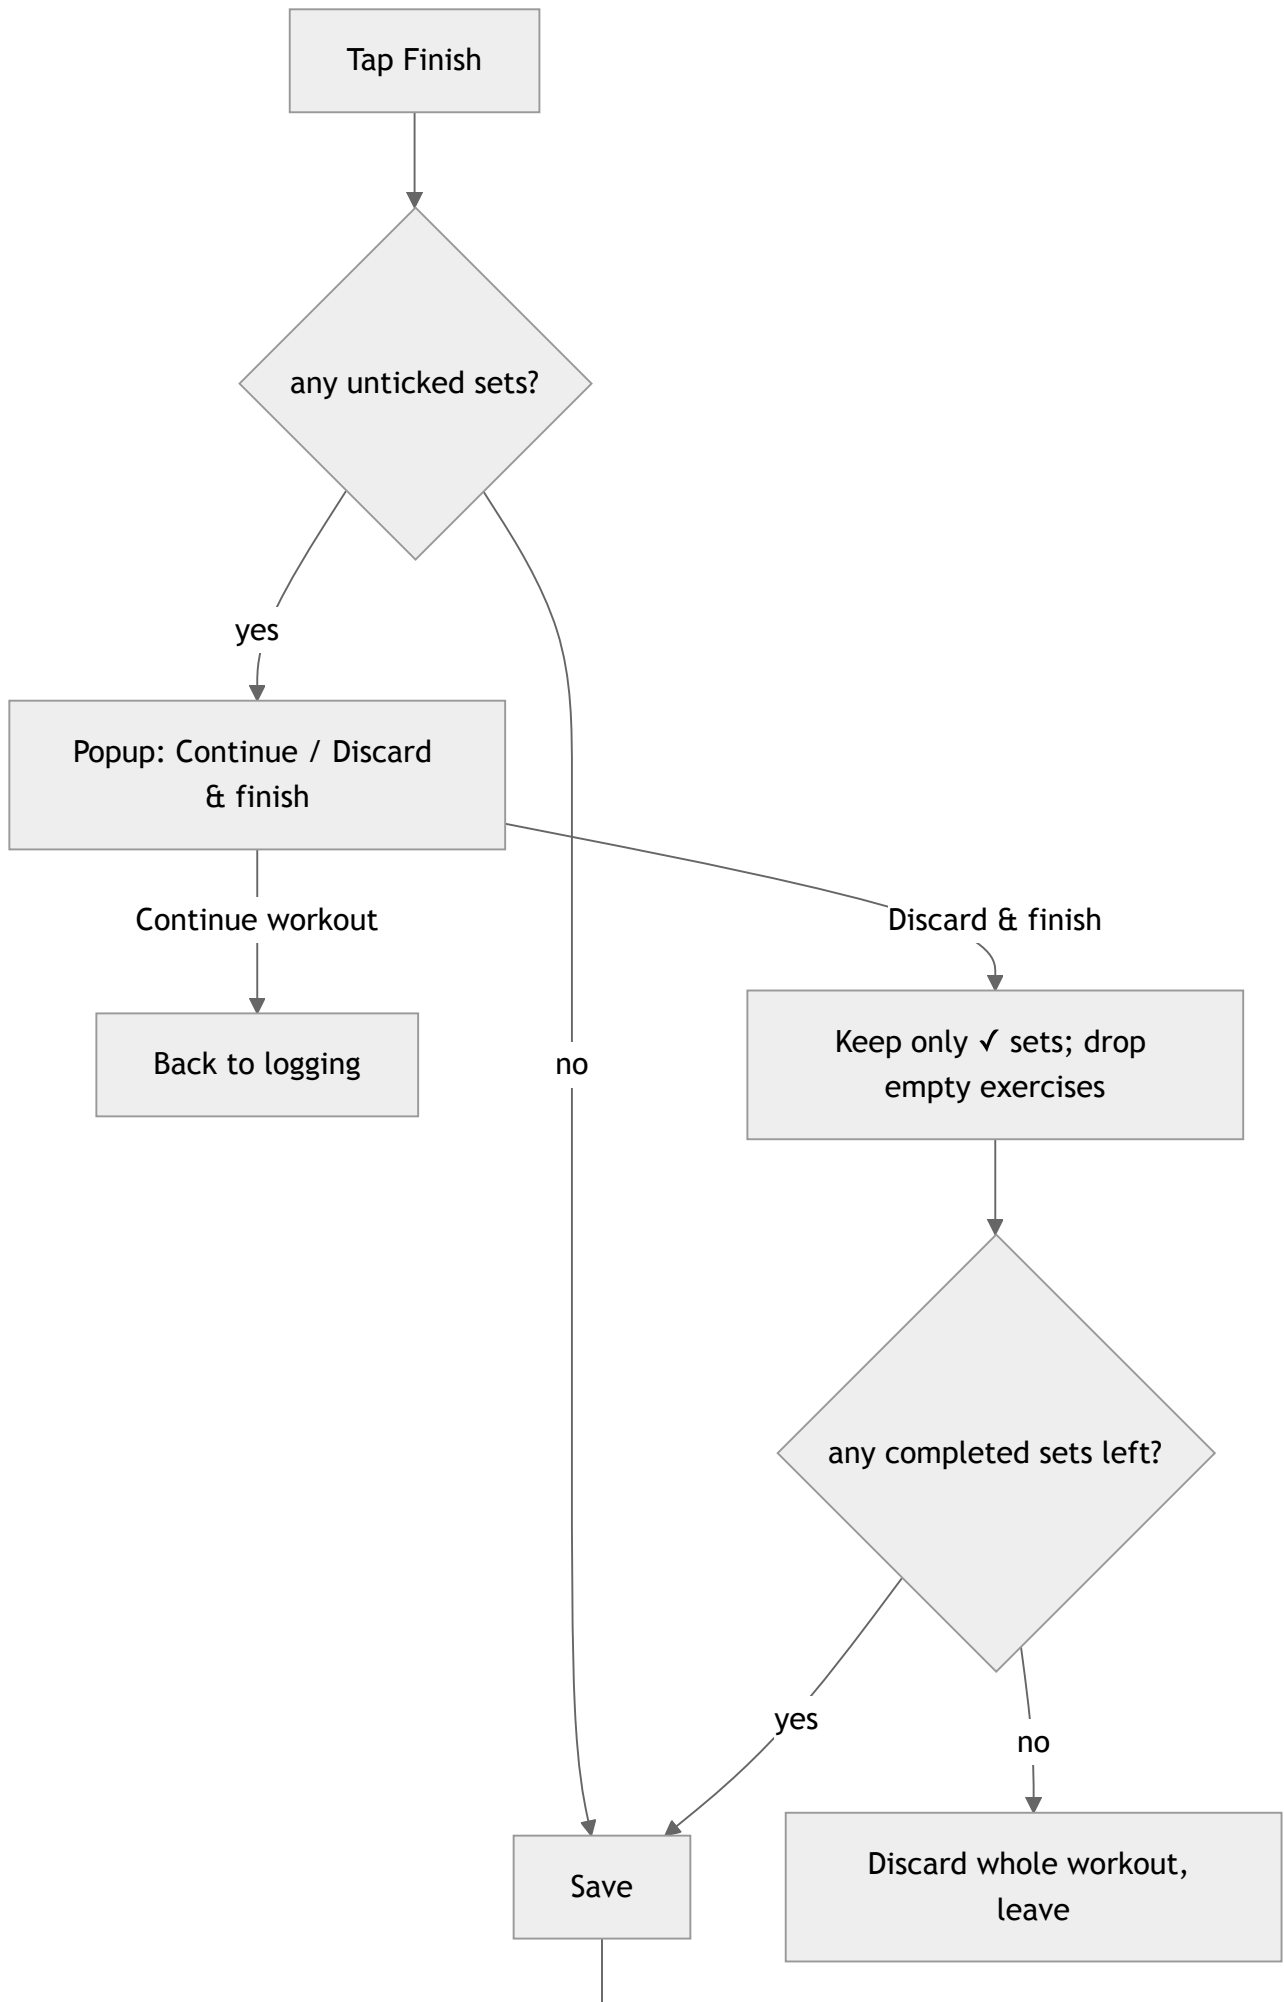

6. Logging a workout (start → complete → finish → save)

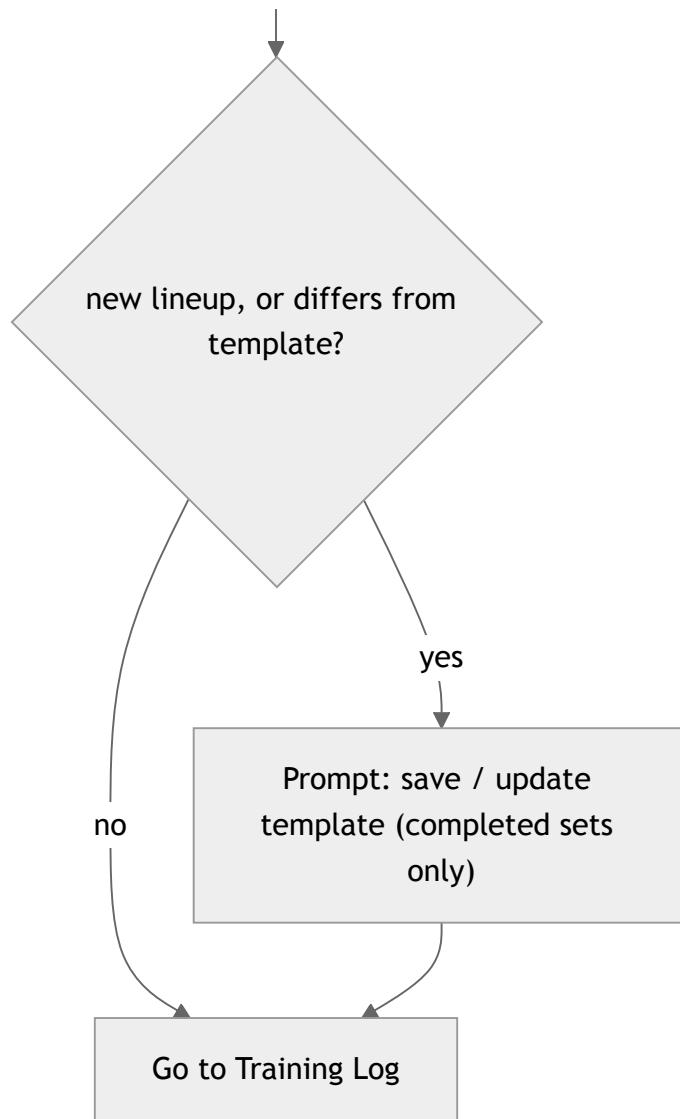

7. A set's lifecycle (placeholder → completed → saved/discarded)

8. Finish-workout decision (discarding unfinished sets)

9. Editing a completed workout
